

ABSTRACT OF THE DISCLOSURE

Electrode substrates, a movable element which  
can freely move reciprocally by being guided by the  
electrode substrates, and in which electrodes are  
5 formed on a pair of surfaces thereof facing one  
another, and which has a lens, an image pickup element  
imaging an image which was image-formed by the lens,  
a control unit controlling a position of the movable  
element, and a stopper regulating movement of the  
10 movable element within the movable range thereof.  
The control unit positions the movable element at  
a predetermined position by making the movable element  
abut the stopper.
